

TAPERED ROOF INSULATION

Houston Foam Plastics provides custom-cut tapered EPS insulation for new construction and re-roof projects. Tapered EPS insulation is the most economical way to eliminate ponding water while also lowering energy costs.

From your plans, our estimators produce detailed shop drawings showing the system layout. The same drawings are used for submittals, production, and installation.

The specific slope used is determined by the drainage needed and the desired total system R value. Standard or custom slopes of 1/16" to 1/2" per foot are pre-cut in a single layer system and factory coded to help installation go smoothly.

Pre-cut saddles, crickets, hips, and valleys all reduce costly job site labor and material waste.

Let us help you design your next tapered roof system.
